

Help Rebuild Nepal

Find the need → verify the need → find the right people → connect them → track whether the need was fulfilled.

I WANT TO HELP →

Register my skills, time, resources

I NEED HELP →

Tell us what my community/project/organization needs

POST A NEED

Who are you?

- Government agency
- Municipality/local government
- NGO/INGO
- Community organization
- Hospital/health facility
- School
- Business
- Individual/community representative
- Other

Where is the need?

- Province
- District
- Municipality
- Ward
- Exact location / map pin

What do you need?

- ☐ Civil engineers
- ☐ Structural engineers
- ☐ Architects
- ☐ Geologists
- ☐ Surveyors

- ☐ Electricians
- ☐ Plumbers
- ☐ Medical professionals
- ☐ Mental health professionals
- ☐ WASH specialists
- ☐ Logistics
- ☐ Construction workers
- ☐ Project managers
- ☐ Data/technology
- ☐ Communications
- ☐ Translators
- ☐ Volunteers/general workforce
- ☐ Other

Then:

How many people do you need?

When are they needed?

For how long?

Remote / on-ground?

Paid / unpaid?

Accommodation available?

Food available?

Transportation required?

Equipment required?

Level of urgency:

-  **Immediate — 0–72 hours**
-  **Urgent — within 1 week**
-  **Upcoming — within 1 month**
-  **Reconstruction — longer term**

And critically:

What exactly needs to be done?

For example:

“Need 2 structural engineers to inspect approximately 40 houses in Ward 7 and assess whether they are safe for occupation.”

That’s dramatically more useful than:

“We need engineers.”

Then create the actual MATCHING ENGINE

This is where your idea becomes much more than a volunteer Google Form.

Imagine a volunteer registers:

Civil Engineer
7 years experience
Structural assessment
Kathmandu
Can travel anywhere in Nepal
Available 5 days
Own transportation
Available immediately

And a verified request comes in:

Sindhupalchok — 3 structural engineers needed — 5 days — accommodation provided — immediate

The system should be able to say:

MATCH FOUND

12 registered volunteers match this requirement.

And then allow them to express interest.

...

verification system:

REQUEST STATUS

-  Submitted
-  Under Review
-  Verified

-  Recruiting
-  Filled
-  Completed

And perhaps:

Verified by:

- Government
- Municipality
- Registered NGO
- Partner organization
- Platform verification team

You can also have a lower-confidence category:

Community-reported need — verification pending

That allows people to report genuine needs without pretending you’ve independently verified them.

...

Create a “Needs Dashboard”

Location	Need	People	Urgency	Status
Sindhupalchok	Structural Engineers	4	 Immediate	Recruiting
Rasuwa	Medical Team	8	 Immediate	5/8 filled
Kavre	WASH Engineers	3	 Urgent	Recruiting

Nuwakot	Architects	5	 Upcoming	recruiting
---------	------------	---	--	------------

Someone can click:

Structural Engineers Needed — Sindhupalchok

And see:

4 people required

1/4 committed

5-day deployment

Accommodation provided

Transportation required

Start: September 2

Verified request

[I CAN HELP WITH THIS]

That's the two-way channel.

Live tracker

THE NEPAL REBUILD NETWORK

12,458 people registered to help

PEOPLE

- 7,892 Remote
- 3,877 On-ground
- 689 Time contributors

EXPERTISE

- 2,890 Engineers
- 1,870 Medical professionals
- 1,430 Architects
- 1,010 Logistics
- 890 WASH
- etc.

DEMAND

- 47 Active requests
- 312 People currently needed
- 186 Volunteers matched
- 94 Positions filled
- 21 Projects completed

Add a “PROJECTS” layer

This is another thing I'd add to your current flow.

Not every need is an individual volunteer.

Some things will become **projects**.

For example:

COMMUNITY SCHOOL REBUILD — RASUWA

Status: Recruiting

Location: X

Project duration: 3 months

Needed:

- 2 structural engineers
- 1 architect
- 1 project manager
- 1 quantity surveyor
- 20 skilled workers
- construction materials
- logistics support

Current team: 8/26

Then different people can join the **same project**.

Keep your “Groups” feature — but change its purpose

Rather than:

“Join a civil engineering group.”

I’d make:

CREATE A SKILL NETWORK

Structural Engineers — Nepal Rebuild Network

87 members

Then the platform can facilitate:

- discussion
- sharing resources
- forming deployment teams
- responding collectively to requests
- creating projects

You could have:

Engineering Network

Architecture Network

Medical Network

WASH Network

Logistics Network

Technology/Data Network

This means your database doesn’t just sit there.

It self-organizes.

Give every volunteer a “readiness profile”

This is a subtle but important improvement.

Don’t only collect:

“I am an engineer.”

Collect enough information to determine **deployment readiness**.

For example:

VOLUNTEER PROFILE

Civil Engineer

Experience:

- Structural assessment
- RCC
- Disaster-resistant construction

Experience: 8 years

Location: Kathmandu

Can travel: **Yes**

Can deploy: **Immediately**

Maximum deployment: **14 days**

Accommodation required: **Yes**

Transportation required: **No**

Own equipment: **Laser level, PPE**

Availability:

Sept 1–15

This becomes an incredibly valuable database for government agencies.

Add “What I Can Bring”

I really like this part of your original thinking and would expand it.

Someone might say:

I can't travel.

But they can provide:

- drone

- laptop
- surveying equipment
- medical equipment
- vehicle
- construction equipment
- software
- professional consultation
- office space
- accommodation
- transportation

So your categories shouldn't only be **people**.

They should be:

PEOPLE • SKILLS • TIME • EQUIPMENT • LOGISTICS • MONEY

Add an “I CAN ORGANIZE” option

This is missing from the current flow.

There are people who aren't necessarily experts but are **excellent organizers**.

For example:

“I can organize 20 volunteers in Pokhara.”

Or:

“I can coordinate accommodation for 50 people.”

Or:

“I can provide a vehicle and driver.”

Create:

I CAN ORGANIZE / COORDINATE

These people could become local coordinators.

You could eventually have:

District Coordinators

who help connect verified needs with available volunteers.

Your admin backend becomes extremely important

I'd actually make this the heart of the system.

Your admin team should be able to see:

COMMAND CENTRE

VOLUNTEERS

12,458

ACTIVE NEEDS

47

OPEN POSITIONS

312

MATCHES

186

VERIFIED REQUESTS

39

UNVERIFIED

8

PROJECTS

24

Then filter:

Province → District → Municipality → Skill → Availability → Urgency

And export:

“All available structural engineers willing to deploy to Bagmati within 72 hours.”

That is exactly the sort of dataset you can eventually hand to government.
